

AN: PAT 1994-350349  
TI: Device to convey fuel from tank to IC engine of motor  
vehicle incorporates cover plate without apertures pressed  
against stop plate  
PN: **DE4315432-A1**  
PD: 10.11.1994  
AB: The device incorporates a cover plate (40). The supply  
member (22,24) is pressed towards the plate by contact pressure  
elements (50). A stop disc (46) is located between the stop  
plate and the facing end faces of the supply member. The stop  
disc is connected to a supply member in direction of rotation.  
The other cover plate has an intake aperture and a pressure  
aperture. The supply members have helical toothing. The stop  
disc consists of a material of low friction coefficient. It is  
coated with such a material on the end face engaging on the  
cover plate.; Fuel pumping device for motor vehicle in which  
friction is generated between stop disc and cover plate only.  
The device has very low operating noise.
